

sam (Sustained Acoustic Therapy)

SAM is invented, researched, and designed in the USA and utilized the most professional and collegiate sports-medicine programs to heal micro-trauma and rehabilitate injuries to soft-tissue (tendons, ligaments, muscle, and cartilage.)

1. James A. Haley Veterans Administration & McDill Air Force Base Florida. (Winkler 2021)

- Clinical evidence demonstrates that SAM is an effective tool to heal MSK injuries, reduce pain, improve mobility, and return patients back to work after an injury. SAM provides vigorous multi-hour diathermy, enhances clearance rates of biological waste, and properties cellular replication and remodeling. The treatment is well received by both patients and providers, is both clinical and cost-effective, and should be considered a good treatment option for practitioners.

2. Healthcare Providers of Military and Sports. (Walters 2022)

- +200 HCPs who use SAM participated in a clinical review of efficacy. SAM is the go-to-treatment option in healing soft tissue injuries and provides significant clinical gains in as little as 2-weeks of daily use and reduces the need to oral medications.

3. Rutgers University, NCAA Division 1 Athletes Return to Play. (Krystofiak 2023)

- SAM + PRP heals grade-2 injuries and returns players back to competition 21.3 days faster than PRP alone. Also provides significant pain reduction, functional improvements, and less variability in the healing/recovery timeline.
